## Factorización no-negativa

Wednesday, September 30, 2020

6:36 PM

1. Sean 
$$x_j$$
,  $h_j$  las  $j$ -ésimas cols. de  $\times y$  H

 $\|x_j - Wh_j\|_2^2 = (x_j - Wh_j)^T(x_j - Wh_j)$ 
 $= x_j^T x_j + (Wh_j)^T (Wh_j) - 2x_j^T (Wh_j)$ 
 $= (Wh_j)^T (Wh_j) - 2x_j^T (Wh_j)$ 

$$9(y) = (Whj)^{T}(Whj) - 2x_{j}^{T}(Whj)$$
  
=  $h_{j}^{T}(W^{T}W)h_{j} - 2(W^{T}x_{j})^{T}h_{j}$   
=  $\frac{1}{2}h_{j}(2W^{T}W)h_{j} - 2(W^{T}x_{j})^{T}h_{j}$ 

$$\Rightarrow$$
 Q = 2W<sup>T</sup>W, c = -2(W<sup>T</sup>x<sub>j</sub>)

2. Sean xi, wi las i-ésimas filas de X y W (xi, wi vectores columna)

$$\|X_i - H^T w_i\|_2^2 = X_i^T X_i + (H^T w_i)^T (H^T w_i) - 2 X_i^T (H^T w_i)$$

$$\begin{array}{l}
\mathbf{q}(\mathbf{y}) = \mathbf{w}_{i}^{T}(\mathbf{H}\mathbf{H}^{T})\mathbf{w}_{i} - 2(\mathbf{H}\mathbf{x}_{i})^{T}\mathbf{w}_{i} \\
= \frac{1}{2}\mathbf{w}_{i}(2\mathbf{H}\mathbf{H}^{T})\mathbf{w}_{i} - 2(\mathbf{H}\mathbf{x}_{i})^{T}\mathbf{w}_{i}
\end{array}$$

$$\implies$$
 Q = 2HH<sup>T</sup>, c = -2(Hx;)
